

Cannabinoid Guide

Cannabinoid: Naturally occurring compounds of medical marijuana that influence the medical benefits of the plant

THC

Tetrahydrocannabinol

Potential Benefits:

- Psychotropic
- Pain Relief
- Relaxation

CBD

Cannabidiol

Potential Benefits:

- Anxiety Relief
- Pain Relief
- Anti-Inflammatory
- Neuroprotective

THCV

Tetrahydrocannabivarin

Potential Benefits:

- Appetite Suppressant
- Pain Relief
- Antibacterial
- Antiviral

CBDV

Cannabidivarin

Potential Benefits:

- Digestive Aid
- Pain Relief
- Relaxation
- Antiepileptic

CBC

Cannabichromene

Potential Benefits:

- Anti-Inflammatory
- Inhibits Cancer Cell Growth
- Anti Depressant (with THC and CBD)

CBG

Cannabigerol

Potential Benefits:

- Metabolic/Digestive Aid
- Glaucoma Relief
- Antibacterial

CBN

Cannabinol

Potential Benefits:

- Appetite Stimulant
- Neuroprotective
- Antibacterial
- Glaucoma Relief

The precursors to the popular cannabinoids above are called **Cannabinoid Acids**, which can have insecticidal and antibiotic properties, but are most beneficial after heated. For example, THCA becomes THC when decarboxylated, producing the cerebral effects most associated with medical marijuana.
